How do i adjust the temperature on my lg refrigerator

Troubleshooting Refrigerators 05/07/2021 Print Email Copy Link When water does not dispense, it may be related to operational issues that can be easily resolved. The recommended temperature for LG refrigerators is 4oF(20oC), if your unit's temperature is lower, this may cause frozen water lines which will prevent water from dispensing. If you see any error code displaying on your refrigerator, please visit our Error Codes - Refrigerator article. Press the dispenser button or lever. Listen to hear if the dispenser hums or sounds like its trying to dispense water. For newly installed units, air may be trapped in the water line between the home water supply and the unit, which will prevent water from dispensing. Try holding down the dispenser lever until it dispenses water. Be sure to discard the first 1-2 gallons of water before consuming. Check if water is getting to the dispenser. To do so, remove the filter and hold it over the sink with the tip facing down. Since there is water is in the filter, this indicates that the water supply is ON, but something is restricting the flow. With the water filter removed, try to dispense water. If the unit requires a bypass, it must be installed. If water dispenses from the unit, this indicates that either the filter needs to be replaced or the water pressure is too low. Water filter that should be changed every 6 months. If not replace regularly as directed, foreign particles may build up on the filter, which will reduce the water pressure and flow rate. If the filter was recently replaced, verify that it is installed correctly. To adjust the water pressure, please visit our Water Supply Section of this content. Order Replacement Water Filter Here If water still doesn't dispense, the unit will require a repair service. Please visit our Request a Repair page. Replace using only LG Brand filters that are not expired. Avoid using Non-LG Brand Water filter and Using a water filter for more than recommended period (6 months) Use of consumable products that are NOT Authorized by LG is not covered under Warranty LG recommends replacing the water filter every six months. If you have been using the filter for more than 6 months issues caused by this are not covered under Warranty This indicates a possible water supply issue. Check the following: Check all water supply valves to make sure they are opened completely. Check the connections behind the refrigerator to make sure all lines are connected. There are multiple connections points, so be sure to check carefully: Connection of the water line to the home water supply valve. Connection of the water line to the back of the refrigerator, at the main inlet valve. If the water lines are not connected correctly, this will cause the refrigerator to leak and will prevent water from dispensing. Sometimes when the unit is pushed back into its place, recently moved or installed, the water line gets kinked or pinched. Check to make sure that the water line is not pinched or kinked. An external filter reduces the water pressure going to the refrigerator, which may prevent water from dispensing properly. In this case, do not use the internal filter. If the refrigerator comes with a bypass, then it should be used instead. If water still dispenses slowly, the output pressure from the external filter may be too low. A water pressure regulator may be installed to increase that pressure. When the lock icon is illuminated, the dispenser and buttons will not operate when pressed. To unlock the dispenser, press and hold the LOCK button for 3-5 seconds to unlock the dispenser, then try dispensing water again. If the dispenser is unlocked but water is not dispensing, proceed to the next step. Next Step If the dispenser does not hum when you try to dispense water, the door switch may be disconnected. Test the door switch according to its type: Push in the door switch to see if the lights turn off. Place a magnet over the switch to see if the lights turn off. Yes No If your unit have two doors, repeat the steps for the LEFT door, using the switch to test if the lights turn off. Otherwise, press YES to continue. Yes No The door switch may be disconnected, even if the lights turn off, a slightly loose connection can cause dispenser issues. Let's take a look at the connection on the door hinge. After checking all connectors and pushing them in firmly, try to dispense again. Does the dispenser hum now? This indicates a possible water supply issue. Check the following: Check all water supply valves to make sure they are opened completely. Check the connections behind the refrigerator to make sure all lines are connected. There are multiple connections points, so be sure to check carefully: Connection of the water line to the home water supply valve. Connection of the water line to the back of the refrigerator, at the main inlet valve. If the water lines are not connected correctly, this will cause the refrigerator to leak and will prevent water from dispensing. Sometimes when the unit is pushed back into its place, recently moved or installed, the water line gets kinked or pinched. Check to make sure that the water line is not pinched or kinked. An external filter reduces the water pressure going to the refrigerator, which may prevent water from dispensing properly. In this case, do not use the internal filter. If the refrigerator comes with a bypass, then it should be used instead. If water still dispenses slowly, the output pressure from the external filter may be too low. A water pressure regulator may be installed to increase that pressure. Excellent, the issue is resolved. There may be air in the water line, so it may delay dispensing for a few minutes. Discard the first 1-2 gallons of water before consuming. Print Email Copy Link *Required question If you are looking for how to set the temperature on a GE refrigerator, this article will guide you on how to do it.How Do You Set the Temperature on a GE Refrigerator?To set the temperature on a GE refrigerator, you have to consider the model first. One of the good features of GE refrigerators is that there are close similarities in their mode of operations, irrespective of the model.The older models have analog temperature controls. They are built in such a way that there are some with two different controls for the fridge and the freezer while some have one control for both.However, newer models tend to come with digital temperature controls. So, let us look at the older models with analog controls.Older Models with Analog Double-ControlThe factory setting for the temperature is 5 and C, with the coldest setting being E or 9. The second control has numbers going from 0 to 9. 0 represents 'Off' and 1 to 9 represent the varying temperatures, 9 being the coldest.Older Models with Analog Single-ControlThese models come with indications from 0-9, with 9 being the coldest temperature. The refrigerator comes from the store with the temperature set at 5 degrees.For these models, all it takes to set the temperatures is to adjust the control dial accordingly.Note: The analog control is usually found on the dispenser panel, behind the fresh food crisper or above it.Models with Digital ControlWith digitally-controlled models, the setting is a little different. They usually come with a factory setting of 37 degrees for the refrigerator compartment and 0 degrees for the freezer compartment.To set them to different points, take the following steps:Step 1Press either the 'Warmer' or 'Colder' keys on the control panel. Doing this displays the current temperature setting for each compartment. The 'Actual Temp' light will come on to show that you are viewing the actual temperature in both the freezer and refrigerator compartments.You do this because the factory setting has it that there will be no digital display on the panel during normal refrigerator operation. The number on the left is the temperature setting of the freezer while that on the right is for the refrigerator:Step 2Now, press either of the 'Warmer' or 'Colder' keys again. The 'Set Temp' indicator light will come on to show that you are viewing the control setting temperature on the refrigerator display.Note: The actual temperatures in the 2 compartments may not be the same as those that show on the control setting. The difference can be attributed to operating conditions and usage.Step 3If you want to set the temperature to a colder point for any of the compartments, press the 'Colder' key for the compartment. That is if you want to decrease it by only 1 degree, press the key once.In other words, press the key until you get to the desired setting.However, if you desire to change the setting after doing the above, you will have to wait a period of 24 hours before doing so. This period gives the unit time to adjust to the setting. Adjusting the setting more than once in less than 24 hours damages the unit.If you want to set the temperature to a warmer point, repeat the same process as detailed above, only pressing the 'Warmer' key this time.Turning the Cooling Function of the Refrigerator Off and OnTo turn off the cooling function of the refrigerator, repeatedly press any of the 'Warmer' keys that are on the freezer or refrigerator sides of the panel.When it gets to the highest number on the side you are pressing, that number will start flashing. When this happens, go over and press the other 'Warmer' key until O FF appears on the display.This display means that cooling is off in the unit. But it does not mean that electrical power in the refrigerator is off.To turn on the cooling function of the refrigerator, press any key of your choice on the panel. 'OFF' will appear on the display.Next, press any of the 'Colder' keys. The original factory temperature setting of both compartments will appear on the display. This returns the compartments to the temperature. This video demonstrates setting and adjusting the temperature on a GE refrigerator. .Check out these other articles...GE Refrigerator Troubleshooting [Quick Guide]How to Replace a GE Ice Maker [Quick Guide]How to Take Apart GE Refrigerator Drawers [Quick Guide]GE Refrigerator Handle [Issues and Fixes]How Old is My GE Refrigerator? [Solved]How to Change the Light Bulb in GE Freezer [Quick Guide]GE Refrigerator Ice Maker Not Getting Water [How to Fix]Important NoteIt's important to avoid repeatedly adjusting the setting of the temperature in any of the compartments. To do this, decide where you want the temperature to be set and set it on the panel. Then, give the unit time to adapt to the new setting.However, if you find that there are issues with setting the temperature and cooling, contact GE immediately to report the issue and request service.Otherwise, chat with our technicians who are readily available to expertly assist you with the problem.Get Instant Help — Ask An Experienced Verified Appliance TechnicianNeed expert help?
